INDEX TO VOL. XXII, RESEARCH BULLETINS 242-250

A
Agricultural Economics Subsection, bulletin from ..........245, 321
Albino rat fluorine toxicosis of ................................165
Animal Chemistry and Nutrition Subsection, bulletin from .....165
Apple varieties, differential reaction to Gymnosporangium Juni-
peri-Virginianae ..................................................113

B
Bacteria and spores, heat resistance of. See "Influence of growth
temperature on the thermal resistance of some bacteria from
 evaporated milk" ..................................................73
"Bacteriology of butter VI. Effect of moisture dispersion on
growth of bacteria," by H. F. Long and B. W. Hammer .... 146
Discussion ..........................................................161
Experimental .........................................................151
Distribution of organisms in under, moderately and thor-
oughly worked butter .............................................153
Effect of moisture dispersion on changes in acidity of
 fat or butter ..........................................................161
Effects of moisture dispersion on butter defects ...............155
Effect of moisture dispersion on changes of numbers of
organisms ............................................................151
Effect of moisture dispersion on pH changes in serum .......155
Historical ............................................................149
Introduction .........................................................149
Literature cited .....................................................163
Procedure and methods ............................................150
Acidity ...............................................................151
Bacterial counts ....................................................151
Distribution of organisms ........................................151
Manufacture of butter .............................................150
Statement of problem ..............................................150
Botany and Plant Pathology Section, bulletin from ..........113
Buchanan, J. H., joint author of "Physical and chemical character-
istics of lard and other fats in relation to their culinary value
I. Shortening value in pastry and cookies" .......................1
Butter, effect of moisture dispersion on growth of bacteria in..146
Butter marketing ...................................................321

C
Cookies, use of lard in ............................................1

D
Dairy Industry Section, bulletin from ..........................73, 145
"Differential mobility within the rural population in 18 Iowa town-
ships, 1928-1935," by Ray E. Wakeley ........................277
Appendix ...........................................................309
Conclusions .........................................................308
Introduction .........................................................279
Scope and method ................................................279
Migration of households ...........................................291
Changes of occupation ............................................293
Changes of residence .............................................292
Changes of residence and occupation ............................294
Range of migration .............................................. 295
Town-country migration ...................................... 298
Unclassified families ......................................... 294
Migration of young people .................................... 284
Age at leaving home .......................................... 286
Present location of children .................................. 287
Return during the depression ................................ 287
Schooling and migration ...................................... 288
Schooling and youth away from home ...................... 289
Sex, age and migration ........................................ 284
Population structure and migration ...................... 281
References cited .............................................. 318
Rural relief situation ......................................... 306
Migration of children from relief families .............. 307
Relief and employment ....................................... 308
Relief and family migration .................................. 307
Tenure status and family migration ...................... 300
Age of operator and tenure ................................ 301
Changes in tenure status .................................... 303
Size of farm and tenure ...................................... 301
Tenure and employment ...................................... 305
Tenure and relief ............................................. 306

"Differential reaction of apple varieties to Gymnosporangium
Juniperi-Virginianae," by George L. McNew ........... 113
Discussion ....................................................... 138
Experimental results .......................................... 121
Experiment of 1933 ............................................ 121
Experiment of 1935 ............................................ 124
Microscopic and histological appearance of sori ........ 125
Description of differential reactions .................... 132
Typical reaction of each variety ......................... 125
Ben Davis ....................................................... 126
Delicious ........................................................ 128
Grimes Golden .................................................. 128
Maiden Blush .................................................. 130
Oldenburg ....................................................... 132
Tolman .......................................................... 132
Turley .......................................................... 126
Wealthy, Rome Beauty and Jonathan .................... 125
York Imperial ................................................... 126
Literature cited ................................................ 141
Materials and methods ........................................ 119
Summary ......................................................... 117
Dough age, effect on breaking strength of pastry .... 25
Drought resistance of inbred lines of sweet corn .... 33

E
Evaporated milk, thermal resistance of bacteria in .... 73

F
"Farm mortgage foreclosures in southern Iowa, 1915-1936," by
William B. Murray ........................................... 245
Appendix tables ................................................ 267
Foreclosures by districts .................................... 260
Crop yield variations ......................................... 263
Deeding of land vs. foreclosure ......................... 262
Differences in farm product prices ..................... 262
Effect on tenancy ............................................. 266
Hammer, B. W., joint author of “Bacteriology of butter VI. Effect of moisture dispersion in butter on growth of bacteria.” 145
Hammer, B. W., joint author of “Influence of growth temperature on the thermal resistance of some bacteria from evaporated milk” ................................................................. 73

I

“Influence of growth temperature on the thermal resistance of some bacteria from evaporated milk,” by D. R. Theophilus and B. W. Hammer ................................. 73
Discussion of results ........................................... 105
Introduction ..................................................... 77
Literature review .............................................. 107
Methods .................................................................. 84
Results ................................................................... 86
Comparison of heat resistance of spores suspended in evaporated milk and in skim milk ........................................................................................................ 86
Comparative thermal resistance of bacteria grown at three different temperatures ........................................................................................................... 90
Comparative thermal resistance of bacteria grown at two different temperatures ........................................................................................................... 87
Comparative thermal resistance of moist and freshly dried spores ................................................................................................................................. 96
Effect of continued growth at a changed growth temperature on the thermal resistance of bacteria ........................................................................................... 94
Examination of normal cans of evaporated milk ........................................... 103
Identification of the cultures ............................................................................. 104
Influence of age on the thermal resistance of dried spores ........................... 99
Influence of a sudden change in growth temperature on the thermal resistance of bacteria ............................................................. 92
Survival periods of bacteria at various temperatures ................................. 100
Thermal resistance of some aerobic, spore-forming bacteria isolated from raw milk ........................................................................................................... 103
Review of literature ....................................................................................... 78
Factors influencing heat resistance of vegetative cells and spores .............. 79
Spore-forming aerobic bacteria in the spoilage of evaporated milk ............ 83
Theories of cell destruction by heat ............................................................... 78
Summary and conclusions ............................................................................. 76

L

Lard, shortening value in pastry and cookies
Comparative shortening power of lards and other fats ................................. 42
Effect of substituting oleic acid for part of the lard ....................................... 39
Relation of breaking strength of pastry and cookies to the chemical and physical constants of the fats ................................................................. 46
Temperature of lard when added to flour ..................................................... 35
Texture and temperature in pastry ............................................................... 34
Smooth vs. grainy .......................................................................................... 34
Varying proportions of leaf and back fat ...................................................... 39
Long, H. F., joint author of “Bacteriology of butter VI. Effect of moisture dispersion in butter on growth of bacteria.” 146
Lowe, Belle, joint author of “Physical and chemical characteristics of lard and other fats in relation to their culinary value I. Shortening value in pastry and cookies” ............................................. 1

4
McNew, George L., author of "Differential reaction of apple varieties to Gymnosporangium Juniperi-Virginianae" ................. 113

Migrations of households ........................................ 291
   Changes of occupation ......................................... 293
   Changes of residence ......................................... 292
   Changes of residence and occupation ......................... 294
   Range of migration ........................................... 295
   Town-country migration ...................................... 298
   Unclassified families ......................................... 294

Migration of young people ......................................... 284
   Age at leaving home .......................................... 286
   Present location of children ................................ 287
   Return during the depression ................................ 287
   Schooling and migration ...................................... 288
   Schooling and youth away from home ......................... 289
   Sex, age and migration ....................................... 284

Mortgage foreclosures. See "Farm mortgage foreclosures in southern Iowa, 1915-36" ................................. 245

Murray, William G., author of "Farm mortgage foreclosures in southern Iowa, 1915-1936" ................................. 245

Nelson, P. Mabel, joint author of "Physical and chemical characteristics of lard and other fats in relation to their culinary value I. Shortening value in pastry and cookies" ................. 1

Nicholls, William H., author of "Post-war developments in the marketing of butter" ............................................. 321

P

Pastry tenderness as determined by breaking strength ........ 20
   Dough age ..................................................... 25
   Varying time between baking and breaking tests ............ 27
   Varying time of mixing the fat with the flour ............... 21
   Varying time of mixing the water with the flour ............ 23

"Physical and chemical characteristics of lard and other fats in relation to their culinary value I. Shortening value in pastry and cookies," by Belle Lowe, P. Mabel Nelson and J. H. Buchanan ......................................................... 1

Investigations ..................................................... 10
   Design of experiments and testing data ....................... 18
   Fats used ...................................................... 12
   Formulas used ................................................ 10
   Incubation of ingredients and temperature control .......... 11
   Other ingredients ............................................. 15
   Procedure .................................................... 15

Literature cited .................................................. 52

Results and discussion .......................................... 19
   Baking temperature for pastry ................................ 38
   Comparative shortening power of lards and other fats in pastry and cookies ............................................. 42
   Day to day variation ......................................... 32
   Effect of manipulative and technic procedures on tenderness of pastry as determined by breaking strength .... 20
   Dough age ..................................................... 25
   Effect of varying the length of time for mixing water with the flour ..................................................... 23
Effect of varying the time interval between baking and breaking tests ........................................ 27
Varying time of mixing the fat with the flour .......... 21
Effect of 3 minutes' creaming upon the breaking strength of eggless cookies ................................ 33
Effect of substituting oleic acid for part of the lard .... 39
Relation of breaking strength of pastry and cookies to the chemical and physical constants of the fats used. 46
Temperature of the lard when added to the flour ........ 35
Temperature rise of the dough during mixing ............ 19
Texture and temperature of the lard in pastry .......... 34
Smooth versus grainy ........................................ 34
Varying proportions of leaf and back fat ................. 39
Review of literature ........................................... 7
Summary .......................................................... 3

"Post-war developments in the marketing of butter," by William H. Nicholls ............................................... 321
Appendix .................................................................. 380
Butter marketing at the end of the war: 1918-1920 ........ 324
Summary .......................................................... 329
Depression years: 1931-1937 ..................................... 345
Summary .......................................................... 368
Developments of 1921-1927 .................................... 329
Summary .......................................................... 336
Economic appraisal .................................................. 379
Introduction ........................................................... 323
Merger and diversification: 1928-1930 .................... 337
Summary .......................................................... 344
Topical list of literature cited .................................. 376

R
Rat, albino, fluorine toxicosis of .............................. 165
Relief situation, rural ........................................... 306
Migration of children from relief families ................. 307
Relief and employment ........................................... 308
Relief and family migration .................................... 307
Roots as related to drought resistance in corn .......... 63
Rural Sociology Subsection, bulletin from ............... 277

S
Schulz, J. A., author of "Fluorine toxicosis in the albino rat" 165
Sodium fluoride, effect on albino rats ....................... 173
Effect on composition of bones ................................ 180
Effect on growth .................................................. 177
Effect on reproduction .......................................... 178
Effect on teeth .................................................... 179
Spores. See "Influence of growth temperature on the thermal resistance of some bacteria from evaporated milk" 73
Stomata, as related to drought resistance in corn ....... 60
"Study of drought resistance in inbred strains of sweet corn, Zea Mays var. Rugosa," by E. S. Haber .......... 53
Literature cited .................................................... 72
Materials and methods .......................................... 58
Effect of high temperature on seedlings ................... 70
Roots .............................................................. 63
Stomata ............................................................ 60
Transpiration ....................................................... 58
Vascular bundles .................................................. 65
Review of literature ........................................ 57
Summary and conclusions .................................. 55
Sweet corn, drouth resistance of ......................... 53

T
Tenure status and family migration ......................... 300
Changes in tenure status .................................. 303
Size of farm and tenure .................................. 301
Tenure and employment .................................. 305
Tenure and relief ......................................... 306
Theophilus, D. R., joint author of “Influence of growth temperature on the thermal resistance of some bacteria from evaporated milk” .................. 73
Transpiration rate in corn as related to drouth resistance .... 58

V
Vascular bundles in corn as related to drouth resistance ...... 65
Vegetable Crops Subsection, bulletin from .................. 243

W
Wakeley, Ray E., author of “Differential mobility within the rural population in 18 Iowa townships, 1928-1935” .................. 277
