# Synthesis and Crystal Structure of Barium Thioborate Ba<sub>7</sub>(BS<sub>3</sub>)<sub>4</sub>S

## Abstract

The thioborate phase Ba<sub>7</sub>(BS<sub>3</sub>)<sub>4</sub>S crystallizes in the monoclinic space group C2/c (No. 15) with  $a = 10.1750(15) \text{ \AA}$ ,  $b = 23.970(4) \text{ \AA}$ ,  $c = 10.1692(15) \text{ \AA}$ ,  $\beta = 90.095(2)^\circ$ , and  $Z = 4$ . The structure consists of isolated trigonal planar (BS<sub>3</sub>)<sup>3-</sup> anions, and isolated S<sup>2-</sup> anions and Ba<sup>2+</sup> cations. The vibrational modes of the isolated (BS<sub>3</sub>)<sup>3-</sup> units were measured from Raman scattering and IR absorption spectra, and the frequencies agree very well with those found for similar orthothioborate phases.

Synthesis and Crystal Structure of Barium Thioborate  $\text{Ba}_7(\text{BS}_3)_4\text{S}$ 

Youngsik Kim and Steve W. Martin\*

Department of Materials Science and Engineering, Iowa State University, Ames, Iowa 50011

Received December 18, 2003

The thioborate phase  $\text{Ba}_7(\text{BS}_3)_4\text{S}$  was synthesized from solid state reaction and its crystal structure determined by single crystal X-ray diffraction analysis. It crystallizes in the monoclinic space group  $C2/c$  (No. 15) with  $a = 10.1750(15)$  Å,  $b = 23.970(4)$  Å,  $c = 10.1692(15)$  Å,  $\beta = 90.095(2)^\circ$ , and  $Z = 4$ . The structure consists of isolated trigonal planar  $(\text{BS}_3)^{3-}$  anions, and isolated  $\text{S}^{2-}$  anions and  $\text{Ba}^{2+}$  cations. The additional sulfur anions have five-fold barium coordination, while the barium cations are coordinated by eight or nine sulfur atoms. Powder X-ray diffraction patterns from a bulk sample are compared to the calculated diffraction pattern from the single crystal structural analysis, and there is excellent agreement in general. The vibrational modes of the isolated  $(\text{BS}_3)^{3-}$  units were measured from Raman scattering and IR absorption spectra, and the frequencies agree very well with those found for similar orthothioborate phases.

The synthesis of suitable thioborate single crystals for single crystal X-ray diffraction is difficult due to the high chemical reactivity of boron sulfide. Thus far, the structure has only been determined for a relatively small number of thioborates ( $\sim 35$ ); surprisingly these thioborates show various structural types and units.<sup>1,2</sup> The boron atom coordinates with either three or four sulfur atoms to form  $(\text{BS}_3)^{3-}$  or  $(\text{BS}_4)^{5-}$  groups. These  $(\text{BS}_3)^{3-}$  and  $(\text{BS}_4)^{5-}$  units may be either isolated or connected to form planar structural  $(\text{BS}_3)^{3-}$ ,  $(\text{B}_3\text{S}_6)^{3-}$ ,  $(\text{B}_2\text{S}_4)^{2-}$ , and  $(\text{B}_2\text{S}_5)^{2-}$  units or polymeric units in chains, layers, or three-dimensional units such as  $(\text{B}_{10}\text{S}_{18}\text{S}_{22})^{8-}$ ,  $(\text{B}_{10}\text{S}_{16}\text{S}_{4/2})^{6-}$ , and  $(\text{B}_{19}\text{S}_{30}\text{S}_{6/2})^{9-}$ .<sup>1,2</sup> The thioborates containing polymeric anionic groups such as  $\text{Ag}_6\text{B}_{10}\text{S}_{18}$ <sup>3</sup> and  $\text{Li}_{6+2x}(\text{B}_{10}\text{S}_{18})\text{S}_x$  ( $x = 2$ )<sup>4</sup> have been considered as ion conduction materials because they possess three-dimensional networks with large open channels.<sup>4</sup> Recently, thioborates have also been investigated as new nonlinear optical materials for infrared applications because of the variety of structural units

and large polarizability of planar structural units.<sup>5</sup> Here we report the synthesis and structure of the new thioborate  $\text{Ba}_7(\text{BS}_3)_4\text{S}$ .

A small yellowish prismatic crystal with approximate dimensions  $0.15 \times 0.15 \times 0.08$  mm<sup>3</sup> was obtained among many other smaller crystal phases from a solid state reaction compositionally batched to yield the orthothioborate phase  $\text{Ba}_2\text{Zn}(\text{BS}_3)_2$ . After preliminary X-ray diffraction experiments suggested that the new  $\text{Ba}_7(\text{BS}_3)_4\text{S}$  phase was proposed instead, the polycrystalline compound  $\text{Ba}_7(\text{BS}_3)_4\text{S}$  was prepared from a stoichiometric mixture of  $\text{B}_2\text{S}_3$  and  $\text{BaS}$  (Cerac, 99.9%). High purity glassy  $\text{B}_2\text{S}_3$  was prepared from amorphous boron (99.9% metal basis, Cerac) and sulfur (99.999%, Cerac) using a modified literature procedure.<sup>6</sup> The  $\text{BaS}$  and  $\text{B}_2\text{S}_3$  stoichiometric mixture was transferred into a vitreous carbon crucible using a He glovebox ( $< 5$  ppm  $\text{O}_2$  and  $< 5$  ppm  $\text{H}_2\text{O}$ ), and then placed inside a dried quartz tube sealed under vacuum. The sealed tube was heated at a rate of  $1^\circ\text{C}/\text{min}$  to  $1000^\circ\text{C}$ , held for 24 h, cooled to  $400^\circ\text{C}$  at a rate of  $1^\circ\text{C}/\text{min}$ , and then quenched to room temperature. A yellowish-white powder was obtained after grinding. The corresponding powder X-ray diffraction pattern<sup>7</sup> agreed well with the calculated peak locations from the single crystal data as shown Figure 1. The X-ray single crystal data were collected at 298 K using the full sphere routine with a Bruker CCD-1000 diffractometer and  $\text{Mo K}\alpha$  ( $\lambda = 0.71073$  Å) radiation.<sup>8</sup>

The structural data of  $\text{Ba}_7(\text{BS}_3)_4\text{S}$  indicate the presence of isolated planar trigonal  $(\text{BS}_3)^{3-}$  anions, barium metal cations  $\text{Ba}^{2+}$ , and additional  $\text{S}^{2-}$  anions configured in a monoclinic unit cell with an adopted space group of  $C2/c$ . Isotypic crystal structures were found for  $\text{Sr}_{4.2}\text{Ba}_{2.8}(\text{BS}_3)_4\text{S}$

and  $\text{Ba}_7(\text{BSe}_3)_4\text{Se}$ ,<sup>9</sup> but  $\text{Ba}_7(\text{BS}_3)_4\text{S}$  has slightly different unit cell dimensions compared to those of  $\text{Sr}_{4.2}\text{Ba}_{2.8}(\text{BS}_3)_4\text{S}$  ( $a = 9.902 \text{ \AA}$ ,  $b = 23.504 \text{ \AA}$ ,  $c = 9.884 \text{ \AA}$ , and  $\beta = 90.01^\circ$ ) and  $\text{Ba}_7(\text{BSe}_3)_4\text{Se}$  ( $a = 10.513 \text{ \AA}$ ,  $b = 25.021 \text{ \AA}$ ,  $c = 10.513 \text{ \AA}$ , and  $\beta = 90.10^\circ$ ). Figure 2 shows planar  $(\text{BS}_3)^{3-}$  anions arranged in layers parallel to the  $a$ -axis and perpendicular to each other within these layers in the structure of  $\text{Ba}_7(\text{BS}_3)_4\text{S}$ . The mean B–S bond length ( $1.823 \text{ \AA}$ ) of the  $(\text{BS}_3)^{3-}$  unit is very similar to that found in  $\text{Sr}_{4.2}\text{Ba}_{2.8}(\text{BS}_3)_4\text{S}$  ( $1.822 \text{ \AA}$ ). Figure 3 presents a structural representation of the two unique  $(\text{BS}_3)^{3-}$  anions in their first cation coordination sphere for the  $\text{Ba}_7(\text{BS}_3)_4\text{S}$  phase, and Table 1 presents corresponding bond lengths and angles. The additional sulfur anions are coordinated by five barium cations to form square pyramids. Ba–S distances range from  $3.058$  to  $3.137 \text{ \AA}$ , within range of those reported for  $\text{Sr}_{4.2}\text{Ba}_{2.8}(\text{BS}_3)_4\text{S}$  ( $3.0$ – $4.5 \text{ \AA}$ ).<sup>9</sup>

Four of the five unique barium cation positions exhibit an eight-fold sulfur coordination, while the Ba(1) position

assigned to the low-frequency bond bending modes and/or transitional modes.

In summary, the crystal structure of Ba<sub>7</sub>(BS<sub>3</sub>)<sub>4</sub>S has been determined by single crystal X-ray diffraction analysis. This structure is based on the isolated planar trigonal (BS<sub>3</sub>)<sup>3-</sup> anions, additional S<sup>2-</sup> anions, and eight- and nine-fold coordinated Ba<sup>2+</sup> cations in a monoclinic unit cell with space group *C*2/*c*. The vibrational modes of the isolated (BS<sub>3</sub>)<sup>3-</sup> structural units are observable in both Raman scattering and IR absorption spectra of polycrystalline samples.

**Acknowledgment.** Funding of this work was provided by Iowa State University Carver Trust Grant. The authors thank Arkady Ellern with the Chemistry Instrumentation Facility at ISU for the collecting the single crystal X-ray diffraction data.
