Abstract
The purpose of this test was to evaluate the experimental modified oil soybean lines adapted to northern Iowa for comparison of agronomic traits. The 2007 Modified Oil Test included 1% linolenic and low saturates of new and commercially grown varieties released by Iowa State University. Oil from 1% linolenic and low saturates soybean varieties grown in Iowa is used in the frying oil market. This oil is healthier for the consumer.

Department of Agronomy

Introduction
The purpose of this test was to evaluate the experimental modified oil soybean lines adapted to northern Iowa for comparison of agronomic traits. The 2007 Modified Oil Test included 1% linolenic and low saturates of new and commercially grown varieties released by Iowa State University. Oil from 1% linolenic and low saturates soybean varieties grown in Iowa is used in the frying oil market. This oil is healthier for the consumer.

Materials and Methods
The modified oil soybean test for the northern district was planted at five Iowa locations—Ames, Charles City, Curlew, Eldora, and Kanawha. At each location, three replications of four-row plots were planted. The plots were 13 ft long with row spacing of 27 in. The seeding rate was nine seeds/foot. Agronomic characteristics evaluated at Kanawha included plant height and lodging susceptibility.

The center two rows were harvested using a self-propelled research plot combine. The moisture and weight of each plot were measured on the combine during harvest. The harvested seed was brought to Ames for seed weight calculation, oil and protein analysis, and fatty acid analysis.

Results and Discussion
The test results of the 1% linolenic experimental line A05-213034, the low saturates experimental line A05-215007, and the commodity variety IA2068 are summarized in Table 1. The data obtained from the test helped determine that A05-213034 and A05-215007 should be released.

Acknowledgements
Thanks to David Rueber, Northern Research Farm superintendent, for helping select the plot site, applying the pre-plant herbicide, preparing the seed bed, and harvesting the border rows.
