Assessment Librarian
Iowa State University

Heather Lewin
Reference and Instruction Librarian
Iowa State University
I. Introduction

Funding agencies that support research and instruction want to know: does the research have an impact within the supported field, and are students learning? In direct response these types of accountability questions, higher education administrators require their colleges, departments, centers, and libraries to quantify their value. LibQUAL+® and Association of Research Libraries (ARL) statistics provide libraries with benchmark data. In addition to ARL surveys, libraries individualize assessments to measure service quality. In the area of teaching and learning, information literacy assessment remains a key performance indicator within libraries.

This research examined 124 of the 126 ARL members’ websites to ascertain the quantity and quality of the publicly available assessment information. This research looked at in-house service quality assessments and in-house information literacy assessments. Additionally the research identified assessment personnel within the ARL libraries.

The relevance of research libraries would be more apparent if library administrators could describe their value to the parent institutions. Public
reporting of assessment illustrates the value of the library. The impact of assessment depends on the quality and comprehensibility of the data presented.

At conferences, new assessment librarians often ask for a template to utilize in conducting assessment. Communication would be enhanced if professional guidelines were developed for addressing assessment issues: design of assessment tools, thoughtful analysis of data, consistent reporting of results, and clear statements of actions to be implemented. ARL libraries need to standardize assessment activities and describe assessment results when appropriate within a value-added framework. To accomplish this, the researchers created an assessment rubric to guide the creation of quality assessments.

II. Literature Review

A review of professional activities and literature illustrates the importance of the value-added metaphor for libraries. For example, when Syracuse University threatened to remove research collections, the value of academic libraries became quickly apparent. After the faculty’s fury regarding the possible removal of some research collections reached Suzanne E. Thorin, the dean of Syracuse University libraries, she said, “It means there’s a lot of burning passion on this. Humanities faculty members have made it clear they consider the library their
central laboratory” (Howard, 2009, p. 1). Conversely, Housewright and Schonfeld (2008, p. 5) wrote:

while [faculty] value the library, they perceive themselves to be decreasingly dependent on the library for their research and teaching and they anticipate that dependence to continue to decline in the future. There appears to be growing ambivalence about the campus library.

Faced with perceived campus ambivalence, libraries must emphasize the value of library services and resources to various constituents -- constituents who are not homogeneous and who often have divergent but essential needs related to research and scholarship.

Mays, Tenopir, and Kaufman (2010, p. 38), touched on this very point when they wrote that the grant-supported Lib-Value: Measuring Value and Return on Investment of Academic Libraries intends to examine how the value of a library varies for diverse stakeholders. Megan Oakleaf’s report (2010, pp. 19-22), supported by The Association of College and Research Libraries (ACRL), described how libraries might assess the impact resources and services have on faculty research success and on student retention. The ACRL’s Assessment Committee,
activities included the creation and maintenance of the ACRL Value of Academic Libraries Toolkit.

Not all assessment activities are based on the value-added framework. The professional group, Library Leadership and Management Association: Measurement, Assessment, and Evaluation Section (2009) developed a toolkit that links to various assessment models. The researchers would argue while many library assessment toolkits do not describe libraries through the lens of the value-added phrase, most library data can be framed within the value-added model.

Library literature describing the implementation of information literacy rubrics for student learning is extensive. Oakleaf (2006, p. 40), identified three useful characteristics of a rubric:

- Formatted on a grid or table
- Employed to judge quality
- Used to translate difficult, unwieldy data into a form that can be used for decision-making

As libraries moved from bibliographic instruction to information literacy learning, instructors developed rubrics as a means to authentically assess learning performance (Knight, 2006, p. 45). Oakleaf, Millet, and Kraus (2011, pp. 833-34)
described how librarians at a workshop engaged administrators and faculty in the development of an information literacy rubric; the successful development and implementation of an authentic information literacy rubric hinged on librarians’ and stakeholders’ collaboration. Choinski, Mark, and Murphey (2003, p. 572) emphasized the importance of rubrics as tools to facilitate objective assessment of learning. Rubrics can provide a means of building stakeholder buy-in, of objectively assessing processes, and of describing value-added outcomes.

**III. Methodology**

The researchers reviewed the 124 ARL members’ websites available in English for publicly accessible assessment data. The researchers focused on in-house Information Literacy (IL) assessment, in-house service quality assessment, and assessment personnel, including positions and committees.

The researchers selected search strategies to optimize locating data points because the websites under review were not similar in design or content. The strategies used included site search, Google site search, and extensive browsing within each library site. Search terms and phrases, including but not limited to “return on investment,” “LibQUAL,” “information literacy,” and “assessment,” were explicitly defined and parameters developed to normalize results.
IV. Results

The researchers gathered and analyzed data for each of the three categories of interest: in-house information literacy (IL) assessment, in-house service quality assessment, and assessment personnel.

In-house Information Literacy

IL assessment tools or measures were generally created in-house and were activity specific; therefore these assessments could not be used for benchmarking without analysis and discussion with the relevant parties. Chart one illustrates the percentage of ARL members that have IL assessments. The data are broken down into three major categories: No public data-meaning no IL assessment can be found, Mentioned-meaning IL assessment is mentioned but not reported with data or a context, and Data, tools or both-meaning IL assessment is reported with data, or with the assessment tool, or with both the data and the tool publicly searchable on the website.
In-house Service Quality

This paper focuses on in-house service quality assessment. Many libraries had multiple types of assessment; the researchers identified over 200 assessment data points related to service quality. These assessments included qualitative and quantitative methods and ranged from, but were not limited to, the implementation of surveys, focus groups, ethnographic studies, grounded theory, statistical analysis, or large-scale longitudinal data analyses. Despite the larger
number of assessments present, nearly 60 percent of ARL libraries provided no service quality assessment.

### Publicly Available ARL Service Assessment Data & Tools

- **No Public data**: 59.7%
- **Data, tools or both**: 36.3%
- **Mentioned personnel only**: 4.0%

### Personnel Assessment Data

The researchers searched for data about assessment committees and personnel. Personnel included both current positions and posted jobs. The ARL libraries were then placed into one of four groups: no personnel or committee, personnel only, committee only, or both personnel & committee (See chart three). Almost 40 percent (49 of 124) of ARL libraries had personnel dedicated to assessment. This number bodes well for the library assessment profession. At the
same time, more than 45 percent (56 of 124) had no public mention of a dedicated assessment librarian, of an assessment committee or of a job posted.

V. Discussion and Implications

Preliminary results show that assessment reporting is not systematic. Lewin and Passonneau (in-press) found that ARL member institutions do not consistently use assessment results to inform strategic documents such as library annual reports and strategic plans. This study can only draw broad conclusions...
regarding the correlation among assessment activities, strategic planning, and program improvement since only publicly available data and documents were analyzed. The results from this research show that across ARL member institutions there is no consistency in assessment activities or in reporting practices.

The researchers identified three main issues regarding assessment activities for ARL members. First, there is a wide variety of assessment data types and activities found on ARL member websites. Secondly, only 62 percent of ARL members had any publicly available assessment data, including both in-house and benchmarking assessments in service quality and information literacy (Lewin and Passoneau, in-press). Lastly, assessment personnel, though growing more prevalent, are often not provided with the same type of support and guidance as other library professionals.

The results of this study confirm a disconnect between the libraries’ public assessment data and the stakeholders’ desires to understand the value of the library within the context of institutional strategic goals or foci. Libraries must collect and report data to demonstrate and prove the vital roles they play within the university.
It is vital that libraries collect relevant data and report assessment results. Shared data allows stakeholders to understand the library enterprise in relation to the parent institution. Publicly available assessment data and resultant actions provide a glimpse into the triumphs, struggles, and future plans of a library. It is important to demystify “what we do” and solidify the libraries’ role within their parent institutions.

At this time, the ARL strategic plan (2010, p. 5) underscores the library’s role in developing assessments that demonstrate added value. However, ARL members’ activities diverge from this professional organization’s recommendations. The DUI, (doing, using, and interacting) model can explain the lag between professional recommendations and professionals’ implementation of the recommendations. The DUI model facilitates knowledge creation and innovation but it takes time for communities of practice to synthesize and adopt new models (Chatterjee and Chatterjee, 2010, p. 50). No matter the reason for the disconnect, it is evident that across ARL libraries there is no standard for developing assessment tools, analyzing assessment results, or reporting assessment finding.
Higher education’s focus on accountability and higher education’s need for data to support accreditation have impacted the assessment field within librarianship. However, many of the personnel are new to the field and have been provided with little guidance. Our research shows while over 50 percent of ARL libraries have assessment personnel or committees, the public reporting of assessment on websites is still minimal.

VI. Rubric

Assessment data on ARL websites was difficult to find and often minimal if present at all. Due to the obvious gaps in libraries’ presentations of their stories, the authors created a rubric to facilitate assessment procedures and reporting practices based on their professional observations. The rubric was designed with four considerations in mind:

1. Facilitate assessment librarians’ implementation and management of projects.

2. Facilitate a professional discussion within the library assessment community regarding useful, flexible standards for reporting assessment activities.
3. Facilitate the understanding of the workflows and processes involved in conducting effective sustainable assessments.

4. Encourage assessment reporting and creation of resultant action plans.

Oakleaf (2007, p. 28) states, “Librarians require tools that facilitate the translation of unmanageable facts and figures into data that can be used to support decision-making. One such tool is a rubric.” Wessels and Birkholz (2010) note, “Rubrics are both a tool and a method for communicating expectations. A rubric describes exactly what is expected in completing a task or producing a product.” A rubric facilitates the description of the parts and levels of performance of a particular task, product, or service (Hafner, 2003, p. 1518).

The assessment rubric produced could be used to develop workflow processes, measurable outcomes, and sound reporting practices. The rubric is an attempt to negotiate best practices and encourage some consistency regarding assessment activities within the library community.

**Rubric Format**

The assessment rubric uses the format found at the Rubric Assessment of Information Literacy Skills (RAILS) website (2010) and the terminology of the
Association of American Colleges and Universities (AAC&U) Value project (2010).

Table one is a blank Rubric template found at the RAILS website (Oakleaf, 2010).

| Table One: Example of a Blank Rubric found at the RAILS website (Oakleaf, 2010) | Blank Rubric: 4 Levels |
|---|---|---|---|
| **Criteria** | **Performance Level Label** | **Performance Level Label** | **Performance Level Label** | **Performance Level Label** |
| | Performance description | Performance description | Performance description | Performance description |

One way the assessment rubric differs in format from other rubrics is the use of the term “category.” The assessment rubric covers the entire assessment cycle, therefore three categories were added to reflect major stages of the assessment process. The sub-categories are the various criteria. The target indicators are labeled from left to right and are scored from 1-4. Within the assessment rubric, all the criteria clarified the scoring for each step in the process. Table two depicts the first category in the process by illustrating the organizational elements of the assessment rubric.

| Table Two: Elements of Assessment Rubric Using the First Category of the Process |
|---|---|---|---|
| Rubric Elements | Categories | Performance Indicator | Rubric Elements |
| Category Heading | **Category 1:** Project Development | Benchmark 1 | Indicators Score |
| | | Milestones 2 | Score |
| | Capstone 3 | | Performance |
| | | Score 4 | |

- □ Creates a vague
- □ Begins to
- □ Adequately
- □ Thoroughly
Library Assessment Rubric Described

The three categories, which are *project development*, *project implementation*, and *project wrap-up*, encompass the totality of the assessment process. Within a category, the specific criteria address different elements of the assessment process. Table four illustrates how all the criteria fit within a category.
Academic libraries’ processes mirror the collaborative aspects of research, learning, and teaching activities occurring throughout the parent university or college. Therefore, all the criteria of the assessment rubric either explicitly or implicitly underscore the need for teamwork during the project cycle. The researchers understand that the assessment process is not linear. There will be times when one criterion will overlap with another criterion within a category. However, the rubric delineates each activity to clarify the process (see appendix A.)

Project Development
During the *project development* phase of an assessment, the project leader will directly ask for input from stakeholders, as indicated by the criterion *Focused Discussion*. Under the criterion *Environmental Scan* the project leader would be wise to ask for input from individuals working in the area related to the assessment activity. Under the two criteria *Internal Data* and *External Data* the project leader should meet with appropriate personnel to conduct an audit of existing data. The final criterion *Tool(s)* can be blended with the criterion *Methodology*. The project manager can receive feedback (if any) from stakeholders about chosen method and tool.

**Project Implementation**

Kaske (2007, pp. 7-9) provided flow charts and work processes that detail best practices for project implementation. Measures to ensure validity and reliability should be addressed while outlining the project. The criterion *Project Outline* delineates this process. The criterion *Timeline* helps the project leader to indicate adequate progress. Under the criterion *Personnel*, all impacted library personnel should be identified and informed about the project.

**Project Wrap-up**
Under the criterion *Analysis*, results should be forwarded to staff and administration asking for input. The criterion *Reporting* outlines best practice for sharing results. Reporting should be precise. Time should be taken in choosing graphs, photos, or other images to effectively relay results as visuals can make or break a presentation. As Tufte (1983, p. 51) eloquently wrote, graphical excellence “consists of complex ideas communicated with clarity, precision, and efficiency,” . . . [and] . . . “requires telling the truth about the data.” Under the criterion *Action Plan* the data must inform the outcomes. Actions resulting from the assessment could be anything from major improvements or minor tweaks. The criterion *Review* prompts the project manager to reflect upon and learn from the activity.

**Conclusion**

The development of this rubric is meant to launch a professional conversation among colleagues regarding assessment practices and standards. As one respected leader (Hiller, 2011) in the assessment community stated, “The activity should drive the metric. The metric should not drive the activity.” The proposed rubric is intended to demystify the assessment process. The assessment rubric is
not meant to be an inflexible protocol but rather a prompt to place the process within the larger context of the parent institution. Additionally, the rubric provides a process for self-evaluation for both new and experienced assessment librarians.

The results from this research illustrate the need to develop professional learning networks to complement the growth of assessment within libraries. The current state of assessment does not parallel ARL’s and ACRL’s support of assessment or these organizations’ strategic plans to demonstrate value. By consistently posting data and resulting actions libraries will be taking the first steps to develop a robust and mature assessment culture that can respond to the demands of parent institutions and stakeholders.

Only through conversation and collaboration with professional groups can a substantive matrix be useful. The rubric we are presenting is a “first pass” at developing a self-evaluative assessment rubric. Professional conversations and group work are needed to refine the rubric. This process will develop professional networks, address ARL’s and ACRL’s strategic plans, and assist in the consistent posting of data, with the end result being the development of a culture of
continuous improvement. In this way libraries will be able to easily declare their value.

THE END
