Each semester, design students have the opportunity of going to the career fair to meet hundreds of different employers. Whether you’re a first-year design student or a veteran to the program, many chances to secure an internship or job await at the career fair. Not only is the event put on for students, but it’s also organized by them as well.

Fifth-year student in architecture Kristen Greteman is the 2011 chair for the College of Design Career Day Expo, so she knows what students can expect to find. Many students can help with the event, and are split up into subcommittees. Advertising, registration and hospitality are only three of the six committees available to work on. The students handle

Having a business degree can be beneficial not only to those who plan on specifically working with business, but to anyone who’s chosen path will intersect with the business field at all. An accredited business degree can be helpful in the search for a high-paying, satisfying job.

"Regardless if I go into business or not, it will still help me. No matter what profession I do choose, I can still be able to think about the consumer and what they want," said Elizabeth Sweeny, open option freshman.

"I think it’s important to take business classes, because it teaches you leadership, and you need that in any job, not just business," said Teegan Ebenhoh, freshman in pre-business.

For students in engineering, a lot of emphasis is placed on a single day of the career fairs. However, there are many things that can give fairgoers an advantage.

Doing well in classes to keep a high GPA, getting involved with campus organizations to boost resumes and gaining as much experience as possible in specific areas of interest are all ways to prepare for the fair. But on the day of, there are other tactics that could make you stand out from others.

Though resumes are extremely important, students must also know how to represent themselves in the best way possible. That includes dressing appropriately, saying the right things and having confidence.

Students in the College of Engineering have a wide array of different interests and skills. However, all of these students have one common goal: to find a job.

"We're kept busy," Kravinsky said. "The flow keeps coming all year round."

When students come into his office, Kravinsky helps students with a variety of issues. He can work with freshmen trying to choose their majors, or graduate students attempting to find jobs.

"They want to get out of here and figure out what employers will hire them," said Elizabeth Sweeney, open option freshmen.

"I think it’s important to take business classes, because it teaches you leadership, and you need that in any job, not just business," said Teegan Ebenhoh, freshman in pre-business.

Internships are an integral part of the college process. For some majors, one is even required. ISU students looking for internships in the Des Moines area must now have a network of online resources.

“Social networking sites now allow students to make contacts and share information in a different way,” said Dr. John Mitchell, ISU career development professor.

In addition to traditional networking sites such as LinkedIn, Mitchell said that Twitter is becoming a popular tool for networking purposes.

“Students can find information via the Internet that helps them find internships,” Mitchell said.

Finding new answers in business

Meet us at the Engineering Job Fair

February 8th

We see the big picture, identify and solve core problems, discover new opportunities and implement the game-changing strategies that deliver sustainable results to companies around the world. We use our niche experience and broad knowledge of supply chain, operations, and information technology to solve complex problems in all areas of a client’s business.
Studying body language can help with job interviews

By Katherine Klingseis

Job interviews can be a lot of stress. Learning the basics of body language can help alleviate this anxiety.

Even Sweet, a visiting professor of psychology and communications and studying a person's body language can help interviewers know what the interviewee is thinking.

People have what's called "mirroring" on their faces. If you sort of see yourself experiencing one of the seven common emotions (happiness, sadness, anger, contempt, disgust, fear or surprise), that's the same emotion that the other person might be experiencing.

"People have a way of mirroring what they're experiencing," Sweet said. "If you sort of see one of the seven common emotions happening, you want to make sure it correlates with someone else's emotions."

"So, if you're talking to someone and you want to know what someone else is really feeling, you can learn a lot from behavior," Sweet said.

Social smiles, on the other hand, do not cause the muscles around the eyes to engage or change the context of the need to be conscientious.

"What people do, because we live in a polite society, is engage in masking behaviors," Sweet said. "If someone is saying, 'It was very nice to meet you,' their head is nodding and they're giving you the nice, genuine smile. I would be more apt to believe that person has his or her legs crossed, cross your legs in a similar manner," Sweet said. "But, of course, individual emotions can have a unique and distinct physiological footprint," Sweet said. "The less these muscles move, the more you know they're experiencing one of the seven common emotions."

"Mimicry, for example, can be deceiving," Sweet said. "We do have automatic emotional responses and those have an expressive nature, automatic smile or eye movement.

"With a genuine smile, what we see is the engagement of the orbicularis oculi, or the set of muscles that go around the eye," Sweet said. "We can observe that emotion better and not focus in on something pulled up." Sweet said. "Just be observant," Sweet said. "We can learn a lot from behavior."

Symbi researchers teach children

By Sarah Binder
iowastatedaily.com

Doing research can be a valuable addition to any resume and a way to give back to the community.

One program that started at Iowa State last fall is doing both of those things with a focus on renewable, efficient energy.

Symbi, Iowa State’s Global Leaders’ Initiative, uses graduate students to teach middle school students about renewable energy. Their students get a $10,000 scholarship for their research and a paid internship.

Next year, the program hopes to increase from six to nine fellows.

“The National Science Foundation is very concerned that good students are being trained to communicate their research and science within a very narrow field. They want to change that approach,” said Adah Leshem-Ackerman, program director of the Center for Biorenewables Chemicals and Energy.

At middle school level, the fellows are forced to have a real-world twist to their research, and present it in an accessible, hands-on way.

Grad students who have participated in the program say it has helped them to present their communication skills, and community outreach skills, in a way that is valuable beyond their academic experience.

“Symbi is very unique because of the middle school level,” said Leshem-Ackerman.

It’s a very unique experience to learn more about what happens in research,” Leshem-Ackerman said.

He said the graduate students chose to do this work because they are interested in renewable energy and want to learn about real research.

He said the kids have developed their lab skills and are also now coming up with experiments to do with students.

“Symbi is very unique, but they don’t see scientists every day,” said Leshem-Ackerman of the middle schoolers in Brook, Harding and Sheldon middle schools.

Sixty percent of the students in these middle schools receive free or reduced-price lunch - an indicator of lower socioeconomic status.

“Combat scientific illiteracy,” said Leshem-Ackerman.

He said that working with students on their science fair projects has helped them to see that there’s more to science than just posters.

The students get a $30,000 stipend and cell biology, said Heather Edwards, graduate student in genetics, development and cell biology.

She said the kids have developed enough so that they can have a scientific dialogue.

“I think there’s a disconnect between what goes on in science classrooms and what goes on in science,” said Mark Newell, graduate student in agronomy.

Newell, graduate student in agronomy and Symbi Fellow, teaches students at Brody Middle School about pollination.

“The kids are very bright, but they don’t see scientists every day,” said Leshem-Ackerman.

He said the fellows aim to share their research in a practical, hands-on way.

“Enter the fellows,” said Leshem-Ackerman.

Sixty percent of the students in these middle schools received free or reduced-price lunch - an indicator of lower socioeconomic status.

He said that parents don’t see that much older and don’t know how to encourage scientific inquiry, and teachers are often too busy managing the classroom.

However, Leshem-Ackerman said that she has seen her students developed enough so that they can have a scientific dialogue.

She said the fellows aim to show students how to become scientists.

Mark Newell, graduate student in agronomy and Symbi Fellow, teaches students at Brody Middle School about pollination.
