Bang’s Disease-Free
RESISTANT HERDS

“If the logical procedure for the ultimate control of Bang’s disease is to build herds which are both free from Bang’s disease and possessed of high resistance to infection. Both experimental work and field results have thoroughly demonstrated that this desirable condition is attainable by proper combination of blood testing and calfhood vaccination.” (Ashe Lockhart, The North American Veterinarian, November, 1939, and previous issues).

The above principles have received official approval in most of the United States, and are being practiced in thousands of herds.

BRUCELLA ABORTUS VACCINE (Lockhart) has been prepared from B.A.I. Strain No. 19 since 1932. It is now recognized that vaccine prepared from smooth colonies has higher immunizing value than rough-colony vaccine. For years Lockhart Brucella Abortus Vaccine has been prepared by methods which eliminate most rough colonies.

Upon graduation, Dr. Glenney secured the practices of Dr. Otto Stader at Elgin, Ill. and Geneva, Ill., which is some twenty miles from Elgin. Recognizing his industry, the Illinois State Veterinary Association at its annual meeting elected Dr. Glenney its new president—just five years after his graduation from college.

Our alumni news items are intended to present the latest activities of your classmates. Naturally, as students, we are quite limited in our sources of information. For that reason we ask you again to contribute those bits of information that you may have. If that information is complete we will use it, otherwise we will try to complete it.
