V.P.C. FEED ANALYSIS* SERVICE

The Vitamineral Products Company has set up a special department for the analyzing of your livestock and poultry rations that are made from home grown grains and roughages. This service is free and will give you the following information.

What your ration contains in digestible nutrients, digestible proteins, fat, fiber, calcium and phosphorus. To furnish this information all you have to furnish us is: The number of pounds of different grains, animal and vegetable proteins and roughages you are feeding.

This service is available only where home grown grains are used in combination with other ingredients which make up your feeding ration.

If your present ration, in our estimation, is properly balanced we will frankly tell you so, or if we feel it should be changed or corrected, we will give you our suggestions.

This service is gratis and we suggest you write us for special forms to furnish the necessary information, and also for test reports. We know we can help you obtain maximum results from your feeding operations.

*In computing our figures we use an average analysis based on many tests of each ingredient as grains and roughages vary in calcium, phosphorus, vitamin and protein contents, depending upon the area in which they are grown and the types of soil peculiar to these areas.

Remember, this service is free.

Write to the VPC Feed Service Division.

VITAMINERAL PRODUCTS COMPANY

Peoria (Established 1920) Illinois

Spring, 1942

Tissue Vaccine

(Continued from page 120) or overshoes removed and thoroughly washed with disinfectant. These procedures are not only proper, but unquestionably tend to create confidence in the veterinarian on the part of his client.

In addition to the proper administration of tissue vaccine for the immunization of swine against cholera, the veterinarian should instruct owners of swine as to the proper practices as regards husbandry and sanitation as they apply to the herds of their clients. It should be emphasized to owners that pigs purchased indiscriminately and particularly through sales yards are poor risks and they should be encouraged to build up their own herds.

The careful administration of tissue vaccine under proper conditions for its use will yield very satisfactory results in preventing losses from hog cholera. The administration of this product is in the hands of the practicing veterinarian and its intelligent successful use is a challenge to his ability as a practitioner.
