Animal Blood Tests

In livestock, as well as in humans, blood-testing has now been accepted in court as a valid means of identifying the father or mother of a disputed offspring, said Dr. L. C. Ferguson, Ohio State University, at the 1947 American Veterinary Medical Association convention.

He predicted that scientific blood-testing may yet play an important part in the breeding of cattle for greater milk production and resistance to disease.

Dr. Ferguson told how years of research have made it possible to test the blood of cattle for the presence or absence of 30 different cell characteristics.

Because a calf can possess a particular characteristic only if the blood of one or both parents contains it, the results of these blood-tests already can be used to identify the sire or dam of a calf.
