Thinking about spraying fungicides? Are you certified? Do you need to be?

Abstract
With the confirmation of soybean rust in the United States and the possibility that it could be present in Iowa in 2005, there are questions regarding the necessary pesticide applicator certifications needed to apply fungicides. The requirements for certification vary depending on whether you are a Private Pesticide Applicator or a Commercial Pesticide Applicator.

Disciplines
Agriculture | Agronomy and Crop Sciences

Thinking about spraying fungicides? Are you certified? Do you need to be?

by Kristine Schaefer, Department of Agronomy

With the confirmation of soybean rust in the United States and the possibility that it could be present in Iowa in 2005, there are questions regarding the necessary pesticide applicator certifications needed to apply fungicides. The requirements for certification vary depending on whether you are a Private Pesticide Applicator or a Commercial Pesticide Applicator.

**Private Applicators**

Fungicides currently labeled (either supplemental Section 18 or full Section 3 labels) for soybean rust are not Restricted Use products. Private applicators will not need Private Pesticide Applicator certification to buy or apply these General Use fungicides. Private applicators are defined as persons who apply Restricted Use pesticides on property owned or rented by themselves or their employers, or on the property of other agricultural producers with whom they trade services.

Both mistakes result in poor disease control and are of little economic benefit.
3. Ensure thorough coverage of the entire soybean plant canopy (see “Spray equipment considerations for foliar fungicide application on soybeans,” page 25–26).

Kristine Schaefer is an extension program specialist in agronomy with responsibilities in weed science and pest management and the environment.

**Commercial Applicators**

Commercial Pesticide Applicators will need to be certified in Category 1C – Agricultural Crop Disease Management to apply fungicides to soybeans. Commercial Pesticide Applicators are defined as persons who apply pesticides for hire on property other than their own.

It is important for everyone to read and follow directions on the fungicide labels. Some fungicide products require specific personal protective equipment (PPE) not typically required. Fungicides that are labeled or have labels pending for soybean rust control and required personal protective equipment, restricted entry intervals (REI), pre-harvest intervals, and additional precautionary statements are listed in Table 1.

Additional information concerning pesticide applicator training and certification can be found on the ISU Pest Management and the Environment Web site at www.extension.iastate.edu/PME.

Plant Diseases

Using fungicides effectively

by Alison Robertson, Department of Plant Pathology

For a fungicide to be effective, three rules must be followed:
1. Select the correct type of fungicide (see “Understanding the fungicides used to treat Asian soybean rust”).
2. Correct timing of the application. There are two common mistakes:
   - Applying fungicides too early can result in the fungicide wearing off before infection occurs.
   - Spraying too late can result in disease development beyond the point where the fungicide is effective.

Both mistakes result in poor disease control and are of little economic benefit.
3. Ensure thorough coverage of the entire soybean plant canopy (see “Spray equipment considerations for foliar fungicide application on soybeans,” page 25–26).

Alison Robertson is an assistant professor of plant pathology with extension and research responsibilities in field and forage crops.

*Different categories of PPE listed (Category A, C, or G) refer to the various categories on the EPA Chemical Resistance Category Chart. This chart and more information may be found at www.epa.gov/pesticides/safety/workers/equip.htm and in the Iowa State University Extension publication PM1878, Guard Your Hands with Gloves. The categories are based on the solvents used in the pesticides, NOT the pesticides themselves.

Notes:
This fungicide guide was based on the latest information available as of February 8, 2005. Please refer to www.soybeanrust.info for the current information on soybean rust management.
No more than two cumulative applications of Section 18 compounds can be sprayed in a single season.
Section 18 labels supersede Section 3 (“regular”) labels.
Fungicide applications should be made between R1 and R5. Always follow the label directions, making certain to check instructions on how to apply, when to apply, waiting periods prior to harvest, whether treated crops can be fed to livestock, and important safety precautions. LABEL PRECAUTIONS AND RESTRICTIONS MUST BE FOLLOWED.
