In the good old summertime …

Abstract
Several things happened the week of June 19 in Iowa, some good and some bad. Summer arrived, it rained too much some places, it didn’t rain enough other places, and there were a few local areas with hail damage. In total, we have received enough heat that we are now slightly above long-term average seasonal heat accumulations in the southern two-thirds of Iowa.

Several things happened the week of June 19 in Iowa, some good and some bad. Summer arrived, it rained too much in some places, it didn’t rain enough other places, and there were a few local areas with hail damage. In total, we have received enough heat that we are now slightly above long-term average seasonal heat accumulations in the southern two-thirds of Iowa.

The keys to economic loss from flooding are the duration of inundation (shorter times are better), the temperature of the floodwater (cooler is better), crop species (soybeans tolerate flooding more than corn in general), and the crop growth stage (younger crops are more damaged in general than older.) Remember that fields that were flooded suffer more from subsequent stresses, and that, if possible, cultivation when the ground is dry again may help encourage aeration to reduce those stresses.

Rich Pope is an extension program specialist in entomology with responsibilities in integrated pest management.
