Prod-Gress

It is important to differentiate the substage of controlled scribbling an estimator of an estimate gradually the child of a population parameter develops more eye-hand coordination referring to a phase of the scribbling a function of the sample random variables he begins to repeat movements $x_1, x_2, \ldots, x_n$ over and over again before a particular sample then proceeds to make circular ones and, therefore, a random variable both types of scribbles appear about the same time
